

Errors in “An Introduction to Categorical Data Analysis, 3rd edition

The following glitches have been pointed out to me (by Brian Marx and Roy St. Laurent) for the first printing of the book:

p. 349: The solution for Exercise 1.13c should not have a negative sign after the first equality sign.

p. 353: The correct solution for Exercise 4.7(c) is $\text{logit}(\hat{\pi}) = -2.0463 + 0.0600(\text{age}) - .00033(\text{age})^2$.
