## Split Plot and Repeated Measures Designs

## Part A. Split Plot Designs

QA.1. An experiment is to be conducted to compare 4 cooking temperatures and 3 mixtures of alloys on strength measurements of steel rods. The cooking period is 2 hours, so that only 4 cooking periods can be conducted on a business day (the temperatures are randomly assigned to periods). The experimenter decides she will assign the 3 mixtures at random to the 3 positions in the oven (experience implies there are no position effects), separately for the 4 runs on a given day. She repeats the experiment over 3 days (randomizing separately on each day). Her assistant provides her the following sequences of random numbers for temperature and mixtures. Give the assignment of treatments to experimental positions (in each cell, enter $\mathrm{Ti} / \mathrm{Mj}$ where $\mathrm{i}=$ Temperature level, $\mathrm{j}=\mathrm{Mixture}$ level).

| Temp | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Ran\# | 0.96 | 0.91 | 0.16 | 0.22 | 0.21 | 0.34 | 0.28 | 0.27 | 0.75 | 0.23 | 0.37 | 0.20 |
| Mix | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 |
| Ran\# | 0.10 | 0.54 | 0.58 | 0.59 | 0.70 | 0.79 | 0.26 | 0.74 | 0.72 | 0.83 | 0.17 | 0.56 |
| Mix | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 |
| Ran\# | 0.29 | 0.64 | 0.43 | 0.76 | 0.65 | 0.56 | 0.97 | 0.28 | 0.06 | 0.83 | 0.76 | 0.64 |
| Mix | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 | 1 | 2 | 3 |
| Ran\# | 0.91 | 0.55 | 0.83 | 0.43 | 0.69 | 0.19 | 0.98 | 0.79 | 0.36 | 0.26 | 0.78 | 0.11 |

|  | Day1 | Day1 | Day1 | Day2 | Day2 | Day2 | Day3 | Day3 | Day3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Pos1 | Pos2 | Pos3 | Pos1 | Pos2 | Pos3 | Pos1 | Pos2 | Pos3 |
| Per1 |  |  |  |  |  |  |  |  |  |
| Per2 |  |  |  |  |  |  |  |  |  |
| Per3 |  |  |  |  |  |  |  |  |  |
| Per4 |  |  |  |  |  |  |  |  |  |

QA.2. A split-plot experiment is conducted to compare 5 cooking conditions (combinations of temperature/time) and 8 recipes for quality of taste of cupcakes. Because of the logistics of the experiment, each of the 5 cooking conditions can be conducted once per day (in random order). The recipes are randomly assigned to the slots in the oven (each recipe is observed once in each cooking condition). The experiment is conducted on 3 different days (blocks). Give the Analysis of Variance (sources and degrees of freedom and critical F-values), assuming no interaction between blocks and subplot units. The response is an average taste rating among a panel of judges.

| Source | Label | df | Error df | F(.05) |
| :--- | :--- | :---: | :---: | :---: |
| Whole Plot Factor |  |  |  |  |
| Blocks |  |  | \#N/A | \#N/A |
| Error1 |  |  | \#N/A | \#N/A |
| Sub Plot Factor |  |  |  |  |
| WP*SP Interaction |  |  |  |  |
| Error2 |  |  | \#N/A | \#N/A |
| Total |  |  | \#N/A | \#N/A |

QA.3. A study was conducted to measure Irrigation and Nitrogen effects on Sweet Corn Row Numbers. Plots were 115 by 63 -feet, arranged in a split-plot design, with four irrigation treatments as whole plots and 15 nitrogen applications randomly allocated on 23 by 21 -foot subplots in each irrigation treatment. There were 3 replications of the experiment (blocks).
pA.3.a. Complete the following ANOVA Table.

| Source | df | SS | MS | F | F(.05) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Rep |  | 5.94 |  |  |  |
| Irrigation |  | 2.49 |  |  |  |
| RepxIrrigation |  | 3.54 |  |  |  |
| Nitrogen |  | 80.92 |  |  |  |
| IrrigationxNitrogen |  | 14.28 |  |  |  |
| Error |  | 29.12 |  |  |  |
| Total |  | 136.29 |  |  |  |

pA.3.b. Compute Bonferroni's MSD for comparing all pairs of Irrigation treatments.
pA.3.c. Compute Tukey's HSD for comparing all pairs of Nitrogen means.

QA.4. A study was conducted to compare 5 Nitrogen levels ( $0,45,90,135,180 \mathrm{~kg} / \mathrm{hectare}$ ) and Rice Straw (Absent/Present) on Rice Grain Yield (100s of $\mathrm{kg} / \mathrm{hectare}$ ). The experiment was conducted as a split-plot design, with whole plot factor being Nitrogen level, and sub-plot factor being Rice Straw. The experiment was conducted in 3 blocks (Years).
pA.4.a. Complete the following Analysis of Variance Table.

| ANOVA |  |  |  |  |  |
| :--- | :--- | ---: | :--- | :--- | :--- |
| Source | df | SS | MS | F | F(.05) |
| WP |  | 5693.63 |  |  |  |
| Block |  | 216.82 |  |  |  |
| WP*Block |  | 60.18 |  |  |  |
| SP |  | 110.82 |  |  |  |
| WP*SP |  | 0.96 |  |  |  |
| Error |  | 6098.94 |  |  |  |
| Total |  |  |  |  |  |

pA.4.b. Assuming no significant Nitrogen/Rice Straw Interaction, compute Bonferroni’s Minimum significant Difference for comparing pairs of Nitrogen level effects. Show which levels are significantly different.

| Nitrogen | Mean | Rice Straw | Mean |
| :---: | :---: | :---: | :---: |
| 0 | 48.65 | 0 | 73.02 |
| 45 | 75.19 | 1 | 76.87 |
| 90 | 79.07 |  |  |
| 135 | 85.85 |  |  |
| 180 | 85.96 |  |  |

Bonferoni MSD = $\qquad$ $\mathrm{Nit}_{0} \quad \mathrm{Nit}_{45} \quad \mathrm{Nit}_{90} \quad \mathrm{Nit}_{135} \quad \mathrm{Nit}_{180}$
pA.4.c. Compute a $95 \%$ Confidence Interval for the effect of Using Rice Straw, versus not using rice straw.

QA.5. A split-plot experiment was conducted, comparing 4 coagulant treatments of camel chymosin (HBCC, LBCC, HCC, LCC) and age ( 4 levels) on $Y=$ strand thickness of melted mozzarella cheese. The experiment was conducted on 3 cheese-making days (blocks), with coagulant treatment as the whole-plot factor, and age as the sub-plot factor.
pA.5.a. Complete the ANOVA Table.

| Source of Variation | df | SS | MS | F_obs | F(0.05) |
| :--- | :--- | ---: | :--- | :--- | :---: |
| WP Factor |  | 59.8 |  |  |  |
| Block |  | 4.8 |  | \#N/A | \#N/A |
| WP*Block |  | 3.36 |  | \#N/A | \#N/A |
| SP Factor |  | 68.7 |  |  |  |
| WP*SP |  | 4.91 |  |  |  |
| Error2 |  | 14.28 |  | \#N/A | \#N/A |
| Total |  |  | \#N/A | \#N/A | \#N/A |

pA.5.b. Assuming the coagulant treatment/age interaction is not significant, compute Tukey's W and compare all pairs of coagulant treatments. $\bar{Y}_{H B C C}=3.42 \quad \bar{Y}_{L B C C}=4.06 \quad \bar{Y}_{H C C}=5.94 \quad \bar{Y}_{L C C}=5.92$
pA.5.c. Assuming the coagulant treatment/age interaction is not significant, compute Bonferroni's $B$ and compare all pairs of age.
$\bar{Y}_{A g e 1}=5.98 \quad \bar{Y}_{A g e 2}=5.86 \quad \bar{Y}_{A g e 3}=4.45 \quad \bar{Y}_{A g e 4}=5.92$

QA.6. An experiment was conducted as a split-plot design in 4 blocks. Within blocks, 4 seed lots (Factor A) were assigned at random to the 4 whole plots. There were 4 seed protectants (Factor $C$ ) assigned at random to the 4 subplots within each whole plot. Assume factors A and C are fixed, and blocks are random. The design of the experiment may have looked like this for Block 1 :

|  | WP1 | WP1 | WP1 | WP1 | WP2 | WP2 | WP2 | WP2 | WP3 | WP3 | WP3 | WP3 | WP4 | WP4 | WP4 | WP4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SP1 | SP2 | SP3 | SP4 | SP1 | SP2 | SP3 | SP4 | SP1 | SP2 | SP3 | SP4 | SP1 | SP2 | SP3 | SP4 |
| Block1 | A4C2 | A4C1 | A4C3 | A4C4 | A1C1 | A1C4 | A1C3 | A1C2 | A2C2 | A2C3 | A2C4 | A2C1 | A3C4 | A3C2 | A3C3 | A3C1 |

pA.6.a. Complete the following ANOVA table.

| Source | df | SS | MS | F_obs | F(0.05) |
| :--- | :--- | ---: | :--- | :--- | :---: |
| Seed Lots (A) |  | 2848 |  |  |  |
| Blocks |  | 2843 |  | \#N/A | \#N/A |
| Seed Lots x Blocks |  | 618 |  | \#N/A | \#N/A |
| Seed Protectants (B) |  | 171 |  |  |  |
| Lots $\times$ Protectants (AB) |  | 586 |  |  |  |
| Error |  | 731 |  | \#N/A | \#N/A |
| Total |  | 7797 | \#N/A | \#N/A | \#N/A |

pA.6.b. Compute Bonferroni's minimum significant difference for comparing all pairs of seed lot means.
pA.6.c. Compute Bonferroni's minimum significant difference for comparing all pairs of seed protectant means.

## Part B. Repeated Measures Designs

QB.1. A repeated measures design is conducted to compare 3 treatments over 4 equally space time points. A random sample of 60 subjects are selected and randomized, so that 20 receive treatment $A, 20$ receive $B$, and 20 receive $C$.
pB.1.a. Complete the following ANOVA table.

| ANOVA |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Source | df | SS |  |  |  |  |
| Treatments |  | 4000 | MS | F | F(.05) | Sig Effect? |
| Subject(Trt) |  | 22800 |  |  |  |  |
| Time |  | 1260 |  |  | \#N/A | \#N/A |
| TrtxTime |  | 84 |  |  | \#N/A |  |
| Error2 |  |  |  |  |  |  |
| Total |  |  |  |  |  | \#N/A |

pB.1.b. Assuming no significant Time by Treatment Interaction, compute Bonferroni's and Tukey's Minimum Significant Differences for comparing all pairs of treatment means.
pB.1.c. Assuming no significant Time by Treatment Interaction, compute Bonferroni's and Tukey's Minimum Significant Differences for comparing all pairs of time means.

QB.2. A Repeated measures design is used to test for effects among 3 treatments at 2 points in time. A sample of 30 subjects is selected, and assigned at random so that 10 subjects receive $\operatorname{Trt} A, 10$ receive Trt $B$, and 10 receive Trt $C$.

The (univariate) model fit is: $y_{i j k}=\mu+\alpha_{i}+d_{k(i)}+\beta_{j}+(\alpha \beta)_{i j}+e_{i j k} \quad i=1,2,3 \quad j=1,2 \quad k=1, \ldots, 10$

The subject within treatment sum of squares is: $S S(\operatorname{Subject}(\operatorname{Trt}))=2 \sum_{i=1}^{3} \sum_{k=1}^{10}\left(\bar{y}_{i \bullet k}-\bar{y}_{i \bullet \bullet}\right)^{2}=4000$

The table of treatment/time means is:

| Trt\Time | 1 | 2 |
| :---: | :---: | :---: |
| 1 | 50 | 70 |
| 2 | 40 | 60 |
| 3 | 60 | 80 |

pB.1.a. Complete the following ANOVA table with corrected total sum of squares $=20,000$

| Source | df | SS | MS | F | F(.05) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Treatments |  |  |  |  |  |
| Subject(Trts) |  |  |  |  |  |
| Time |  |  |  |  |  |
| Trt*Time |  |  |  |  |  |
| Error |  |  |  |  |  |
| Total |  |  |  |  |  |

pB.1.b. Compute Tukey's HSD and Bonferroni's MSD for comparing pairs of treatment means

Tukey's W = $\qquad$ Bonferroni's $B=$ $\qquad$

QB.3. A Repeated measures design was used to test for effects of an treatment to reduce fear of spiders. There were 2 treatments (eye movement desensitization (EMD) and control) at 2 points in time. A sample of 14 subjects was selected, and assigned at random so that 7 subjects received EMD, and 7 received Control. The response was distance that the subject moved spider cage to him/her on a conveyor.

The (univariate) model fit is: $y_{i j k}=\mu+\alpha_{i}+d_{k(i)}+\beta_{j}+(\alpha \beta)_{i j}+e_{i j k} \quad i=1,2 \quad j=1,2 \quad k=1, \ldots, 7$
The subject within treatment sum of squares is: $\operatorname{SS}(\operatorname{Subject}(\operatorname{Trt}))=2 \sum_{i=1}^{2} \sum_{k=1}^{7}\left(\bar{y}_{i \bullet k}-\bar{y}_{i \bullet \bullet}\right)^{2}=900$

The table of treatment/time means is:

| Trt\Time | 1 | 2 |
| :---: | :---: | :---: |
| 1 | 62 | 56 |
| 2 | 50 | 44 |

pB.3.a. Complete the following ANOVA table with corrected total sum of squares $=14,450$

| Source | df | SS | MS | F | F(.05) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Treatments |  |  |  |  |  |
| Subject(Trts) |  |  |  |  |  |
| Time |  |  |  |  |  |
| Trt*Time |  |  |  |  |  |
| Error |  |  |  |  |  |
| Total |  |  |  |  |  |

pB.3.b. Compute a $95 \%$ Confidence Interval for the difference $\mu_{\text {EMD }}-\mu_{\text {Control }}$

QB.4. A study compared 3 foods on serum glucose levels. A sample of 12 subjects were selected, and randomized such that 4 people received Food A, 4 received Food B, and 4 received Food C. Each subject's glucose levels were observed at 3 time points after eating the meal ( 15,30 , and 45 minutes).
pB.4.a. Complete the following ANOVA table.

| Source | df | SS | MS | F | F(.05) | Significant? |
| :--- | :--- | ---: | :--- | :--- | :--- | :--- |
| Food |  | 1020.67 |  |  |  |  |
| Subject(Food) |  | 413.33 |  |  |  |  |
| Time |  | 170.17 |  |  |  |  |
| Food*Time |  | 869.67 |  |  |  |  |
| Error2 |  | 128.17 |  |  |  |  |
| Total |  | 2602.00 |  |  |  |  |

pB.4.b. The means for each food/time combination are given below. Use Bonferroni's method to compare all pairs of food, separately for each time (treat each time as a separate "family", when making adjustment).

| Food\Time | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: |
| 1 | 19 | 35 | 31.5 |
| 2 | 22 | 20 | 11.5 |
| 3 | 26 | 27.25 | 35.75 |

Time 1: Food $_{1}$ Food $_{2}$ Food $_{3}$ Time 2: Food $_{2}$ Food $_{3}$ Food $_{1}$ Time 1: Food $_{2}$ Food $_{1}$ Food $_{3}$

QB.5. A study compared doses of a drug on female rats' activity levels in a maze. A sample of 91 rats were selected, and randomized such that 21 rats received the Control Dose, 25 received Low Dose, 24 received Medium Dose, and 21 received High Dose. Each rat's activity levels were observed at 4 time points after dosing ( $15,30,45$, and 60 minutes).
Hint: There are a total of $21+25+24+21=91$ rats in the study.
Complete the following ANOVA table. The dose and time means are given in the second table.

| Source | df | SS | MS | F | F(0.05) | Significant? |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Dose |  |  |  |  |  |  |
| Rat(Dose) |  | 176677 |  | \#N/A | \#N/A | \#N/A |
| Time |  |  |  |  |  |  |
| Dose*Time |  | 2161 |  |  |  |  |
| Error2 |  |  |  | \#N/A | \#N/A | \#N/A |
| Total |  | 465319 | \#N/A | \#N/A | \#N/A | \#N/A |

| Trt | n_dose | Time1 | Time2 | Time3 | Time4 | Mean |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Control | 21 | 165.9 | 136.3 | 121.4 | 103.4 | 131.8 |
| LowDose | 25 | 167.8 | 148.4 | 123.7 | 118.4 | 139.6 |
| MidDose | 24 | 168.3 | 140.3 | 117.2 | 109.8 | 133.9 |
| HighDose | 21 | 184.4 | 156.2 | 136.3 | 122.7 | 149.9 |
| Sum/Mean | 91 | 171.3 | 145.3 | 124.4 | 113.7 | 138.7 |

QB.6. A repeated measures design is conducted to compare 3 treatments over 3 time points, with 10 subjects per treatment. The model is:
$Y_{i j}=\mu+\alpha_{i}+\beta_{j(i)}+\tau_{k}+(\alpha \tau)_{i k}+\varepsilon_{j k(i)} \quad i=1,2,3, j=1, \ldots, 10 ; k=1,2,3$
$\beta_{j(i)} \sim \operatorname{NID}\left(0, \sigma_{\beta}^{2}\right) \quad \varepsilon_{j k(i)} \sim \operatorname{NID}\left(0, \sigma^{2}\right) \quad\{\beta\} \perp\{\varepsilon\} \quad \sum_{i} \alpha_{i}=\sum_{k} \tau_{k}=\sum_{i}(\alpha \tau)_{i k}=\sum_{k}(\alpha \tau)_{i k}=0$
pB.6.a. Under this model, give the within subject variance-covariance matrix.
pB.6.b. The treatment means are: $\bar{y}_{1 . \bullet}=90.6 \quad \bar{y}_{2 . \bullet}=95.3 \quad \bar{y}_{3 \bullet \bullet}=108.7$. Complete the following ANOVA table.

| Source | df | SS | MS | F | F(.95) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Trts |  |  |  |  |  |
| Subj(Trt) |  | 11360 |  | \#N/A | \#N/A |
| Time |  | 727 |  |  |  |
| TrtxTime |  | 279 |  |  |  |
| Error=Time*S(Trt) |  |  |  | \#N/A | \#N/A |
| Total |  | 18473 |  | \#N/A | \#N/A |

pB.6.c. Assuming there is a significant interaction, based on Bonferroni's method, test for significant differences among all pairs of treatments at the $3^{\text {rd }}$ time point
$\bar{Y}_{1 \bullet 3}=102.6 \quad \bar{Y}_{2 \bullet 3}=108.1 \quad \bar{Y}_{3 \bullet 3}=102.6 \quad \hat{V}\left\{\bar{Y}_{i \bullet k}-\bar{Y}_{i \bullet \bullet k}\right\}=\frac{2\left(M S_{B(A)}+(t-1) M S_{\text {ERR } 2}\right)}{n t}$
pB.6.d. Give the ANOVA estimates for $\sigma^{2}$ and $\sigma_{\beta}^{2}$
